In Advances in Entomopathogenic Nematode Taxonomy and Phylogeny the numerous species of Steinernema and Heterorhabditis described since the previous volume, published in 2007, are evaluated and discussed. Valid species proposed from 2007-2015 are covered in detail, each taxon having an illustrated diagnostic description and additional data on molecular characterisation, distribution and biology, etc.

From such origins arose two distinct lineages of nematode-bacterium entomopathogens, Steinernema-Xenorhabdus and Heterorhabditis-Photorhabdus. Herein, we present a summary and discussion of the known evolutionary diversity and systematics of these two groups relative to other nematodes and bacteria, and their shared evolutionary history.

The new book, "Advances in Entomopathogenic Nematode Taxonomy and Phylogeny" by the same authors, came out in 2016 and in a nice hard cover. Just in time. The book is divided into 6 main chapters. The introductory section gives the perspective of the authors and briefly describes the current situation in EPN systematics.

Introduction. The use of beneficial or entomoparasitic nematodes (EPNs) as a biocontrol measure for insect pests is increasing because they provide several advantages: (i) more effective than chemical agents; (ii) persist within soil; (iii) sustainability; and (iv) safe for user and environment [1-5].The problem of insect resistance to chemicals has created a genuine interest in EPNs and ...

Research on the use of entomopathogenic nematodes as biocontrol agents has been carried out to control the woodwasp (pine trees), codling moth (apples and pears), false codling moth (citrus and deciduous fruit), mealybugs (citrus and grapevine), fruit fly and weevils (deciduous fruit) and the sugarcane stalk borer (sugarcane) in local production areas.

A range of specialist and generalist microorganisms in the rhizosphere attacks plant-parasitic nematodes. Plants have a profound effect on the impact of this microflora on the regulation of nematode populations by influencing both the dynamics of the nematode host and the structure and dynamics of the community of antagonists and parasites in the rhizosphere. In general, those organisms that ...
