Ray Tracing In One Weekend

In Ray Tracing in One Weekend, you will build a simple brute-force path tracer. Continuing with Ray Tracing: The Next Week, you will add textures, volumes (like fog), rectangles, instances, lights, and support for lots of objects using a bounding volume hierarchy (BVH).

Ray Tracing in One Weekend Series

The one thing that all ray tracers have is a ray class, and a computation of what color is seen along a ray. Let's think of a ray as a function $p(t) = A + t \cdot B$. Here p is a 3D position along a line in 3D. A is the ray origin and B is the ray direction. The ray parameter t is a real number (float)

As implied by the title, I was able to complete Ray Tracing in One Weekend in about 10 hours, including translating all of the source from C++ to Swift as I went. There's a reason this book is so popular: It's difficult to explain deep technical subjects like this concisely and Shirley does it well.

Ray Tracing in One Weekend by Peter Shirley

Chapter 1 in Ray Tracing in One Weekend ends with generating an image with a simple gradient for red & green channels. In a serial language, you use nested for loops to iterate over all of the pixels. In CUDA, the scheduler takes blocks of threads and schedules them on the GPU. But, before we get to that, we have to set up a few preliminaries...

Ray Tracing in One Weekend Book Series

Ray tracing introduces several new workloads (tasks) for the GPU to perform. The first is determining which triangles (geometric primitives) in the game scene that rays will intersect. A tree-based ray tracing acceleration structure called a Bounding Volume Hierarchy, or BVH, is used to calculate where the rays and triangles intersect.
